---

A food balance summarizes in statistical form the food supply of a country. This is the second of four bulletins which contain estimated food balances for some 82 free world countries for the 3-year period 1959-61. This bulletin updates and improves food balances for 1957/58 published in FAS-M-100, October 1960.

Basic data for constructing food balances vary greatly in adequacy, both from country to country and from product to product within a given country. The figures shown here, especially those relating to utilization, should therefore be regarded as approximate. Such statistical limitations, and others indicated in the text and footnotes, are mentioned as a caution and to point out possibilities for future improvement. Nevertheless, these food balances make possible a more meaningful analysis of regional and world food supplies, providing data needed for establishing and implementing U.S. policies.

Overall direction of this project and coordination of the four bulletins was by Charles A. Gibbons, Statistician, Foreign Regional Analysis Division.

## FOOD BALANCES FOR 16 COUNTRIES OF WESTERN EUROPE, 1959-61 1/

### INTRODUCTION

Western Europe now supports about 320 million people, a tenth of the world's population. Most countries in the region produce enough food and products that can be traded for food to maintain consumption at high levels. Although agriculture engages only about one-fifth of the labor force, food production per capita of the total population (excluding food produced from imported feed) compares favorably with production in other regions. Livestock products account for about 60 percent of the value of food output. Western Europe imports the larger part of all food and feed entering international trade channels on a commercial basis, including three-fourths of the fats and oils; two-thirds of the eggs, cheese, and butter; half the meat; over one-third of the wheat; two-thirds of the feed grains; and most other feed-stuffs. Some of this imported feed is exported in the form of livestock products along with important quantities of fruits, nuts, and olive oil.

The pattern of food production, dependence on imports, and availability of exports varies sharply from one part of Western Europe to another. For example, livestock production is by far the most important segment of agriculture in most of Western Europe north of the Alps and the Pyrenees, whereas crops for direct human consumption predominate in the Mediterranean countries of Greece, Italy, Portugal, and Spain. The United Kingdom must import a substantial proportion of its supplies of most foods, whereas Denmark depends on an export surplus of most livestock products for its economic health.

Overall food consumption levels in Northern Europe change little from year to year, although the Mediterranean countries have been showing a steady increase. Average consumption for Western Europe as a whole is now about 2,900 calories per person per day (excluding alcoholic beverages), ranging from about 2,500 in Portugal to more than 3,450 in Ireland. The composition of the diet also shows great variation from country to country. Grain consumption is high in the Mediterranean countries, accounting for half of the calories in the Italian and Greek diets, compared with about one-fourth in Denmark and Sweden. All countries with low grain consumption have relatively high consumption of potatoes and sugar. In the Mediterranean countries, per capita consumption of meat, fish, eggs, milk, and cheese is relatively low, but consumption of pulses, fruits, and vegetables is high.

By agreement with the Food and Agriculture Organization of the United Nations (F.A.O.) and the Organization for Economic Co-operation and Development (O.E.C.D.), we have utilized as basic data the O.E.C.D. food balances for 1959/60-1961/62, published in Food Consumption in the O.E.C.D. Countries, O.E.C.D., Paris, March and November 1963. These data have been adapted to a list of products somewhat different from that used by the O.E.C.D. in order to make the list comparable to those used for other regions of the world.

The food balances in this publication contain combinations of data which may appear to differ from seemingly like data published elsewhere. Production data for raw sugar include the raw sugar-equivalent of syrup and honey; fruits and vegetables include fresh, dried and preserved products; while fish includes landed weight of fresh fish and fresh-equivalent of preserved fish. Trade data, because of a lack of precision in reporting, contain the above combinations and others which we have adjusted as follows: wheat includes the wheat-equivalent of flour; potatoes include the potato-equivalent of potato starch for food; milk includes cream; evaporated milk includes evaporated and condensed whole and skim milk; and dried milk includes both whole and skim. In addition to these known problems, trade in live animals appears to be included sometimes but not always in trade in meat; meat may be carcass weight or may include some boned meat and other products. Trade in fats and oils generally excludes trade in inedible materials but often includes edible fats and oils used for manufacturing non-food products.

The reader should be aware of differences in the quality of the statistics in these food balances. Data on population, production, trade, industrial use, and seed are relatively accurate but estimates of changes in stocks, waste, and feed are often used as balancing factors and may deviate substantially from the true value. For instance, most countries assume that waste accounts for 2 or 3 percent of production of wheat, but Denmark and Ireland assume 10 percent or more. Extraction rates are often approximate or representative of only the larger, more efficient mills. "Food consumption per day" in tables 1 and 2 is the estimated quantity reaching the retail level and thus includes storage losses, kitchen waste, and plate waste occurring in homes, restaurants, and other places where meals are prepared.

### EXPLANATION OF SYMBOLS IN TABLES

Notations used in the food balance tables are as follows:

- / A split year composed of parts of the two years shown.
- An average for the period of years indicated.
- ... None, negligible, not available, or not applicable.
- \* ERS estimate.

1/ Prepared by the West European Branch, Foreign Regional Analysis Division, with coordination by David W. Riggs.
